

## A NEW WORLD OF INNOVATION

Thanks to the bipartisan efforts of Congress and the White House, America is taking giant steps in maintaining our global competitiveness. Recent legislative action to increase funding for basic science research, along with the extension of the R&D tax credit, have helped secure America's leadership in innovation. But the job is not finished— we must continue to make these vital investments, while we strive to improve math and science education for all American students and liberalize our rules for admitting highly skilled workers to the U.S.

We owe our current prosperity and security to the investments of past generations, and we owe it to the next generation to renew our commitments to education and innovation. Let's finish the job we started and ensure America's competitive future.
